The Ritz-Carlton in San Francisco
240 kW microturbine/abs. chiller system

Quick Facts
Location: 
San Francisco, CA
Capacity:
PureComfort™ system from UTC Power with 240-kW (four 60-kW Capstone C-60 microturbines)
Fuel: Natural gas
CHP system:
120 RT double-effect absorption chiller from Carrier Corp.
Chiller performance: >1.3 COP
Noise: <65dBA at 30 feet with sound suppression system
System Online: October 2005
Total Project Cost: $1,012,640
Energy Cost Savings:
Approximately $120,000/year
Estimated Payback Time:
8 years (without incentives), under 3 years with incentives
Funding Sources:
Host Hotels and Resorts, CA
Self-Generation Incentive Program, and U.S. Department of Energy

Project Overview
The Ritz-Carlton San Francisco is the city's highest-rated hotel, located in the upscale Nob Hill area. This luxury hotel, which is owned by the Host Hotels and Resorts, accommodates 336 guest rooms, Fitness Center, indoor pool, whirlpool, and steam rooms.

A plan to lower energy consumption and reduce energy expenses for the hotel resulted in the purchase of the PureComfort™ 240 Combined Cooling, Heating and Power (CCHP) package from UTC Power Company. This system includes four 60-kW Capstone microturbines, running on natural gas, with the exhaust collected in a manifold and used to drive a 120 refrigeration tons (RT) double-effect chiller from Carrier Corporation (a sister company from UTC Power). The peak electricity demand at the Ritz-Carlton is 1 MW and chilling requirements can reach almost 300 RT. The PureComfort™ solution provides 240 kW of power and 120 RT of chilling and is therefore able to run base-loaded for the entire year, resulting in near maximum overall efficiency for this type of system. The system is designed to satisfy the base-load chiller demand for the whole year and run the chiller in the most efficient mode. The PureComfort™ solution is able to achieve an overall fuel utilization of greater than 80%.

Costs & Financial Incentives
- Turbines: $224,640
- CHP unit: $141,000
- Mechanical and electrical: $502,000
- Consulting: $16,000
- Project management: $77,000
- Other costs: $52,000, Total: $1,012,640
To mitigate these costs the Ritz-Carlton has received a $150,000 rebate from California’s Self Generation Incentive Program (SGIP) as well as a $500,000 grant from the U.S. Department of Energy for installing an advanced CHP demonstration project.

Originally, the hotel used a 300 RT electric chiller. This was relatively inefficient because it had to run 24 hours a day year-round, even though typical chilling needs were well below its capacity – only about 100 RT for eight months of the year. Operated in this way, the chiller accounted for about 20% of the hotel’s total electricity use. The new configuration - using the absorption chiller - allows for shutting off the 300 RT chiller for eight months of the year. The overall net energy cost saving is estimated at $120,000 per year.
The 240 kW “Pure Comfort” microturbine system at the Ritz-Carlton saves enough electricity to power 200 average American households.

The CHP system installed at The Ritz-Carlton reduces emissions of 800 tons of CO₂ per year. This is equivalent to removing 140 cars from California roads.

To ensure the luxurious ambiance for guests of the five-star hotel, CHP system noise and visibility was a major issue. The picture to the right shows the view from the cocktail lounge towards the microturbine system. The system is placed behind the white wall and does not affect the guests’ view.

The picture to the left shows the four C-60 Capstone microturbines. The absorption chiller is oversized to 300 RT and currently delivers a maximum of 120 RT, giving the Ritz-Carlton the possibility of adding additional microturbines without the need to change the chiller.

UTC Power PureComfort™ System

The PureComfort™ 240M microturbine-based CHP solution is one of three available standard packages from UTC Power. Other available packages include the 300M and 360M systems, with 300 or 360 kW of power output rating. Each system consists of a double-effect absorption chiller/heater from Carrier Corporation and four to six 60-kW microturbines. This standardized approach reduces system costs and results in an average overall thermal efficiency of greater than 80%. The relatively quiet system (65dBa @ 30 feet with sound suppression system) consists of the core microturbine units with height of 83”, width of 30”, length of 77”, and weight of 1,700 lb., as well as the chiller with a height of 82”, width of 79”, length of 145”, and weight of 18,544 lbs. The system emits less than 0.49lb/MWh electricity of NOx.
